However, they suffer from many of the limitations for their use in electric means of transportation and other high I. ••The review covers latest trends in electrode materials. ••Newer electrode. Reducing the CO₂ footprint is a major driving force behind the development of greener. The high capacity (3860 mA h g⁻¹ or 2061 mA h cm⁻³) and lower potential of reduction of -3.04 V vs primary reference electrode (standard hydrogen electrode: SHE) make the a. The cathodes used along with anode are an oxide or phosphate-based materials routinely used in LIBs. Recently, sulfur and potassium were doped in lithium-manganese spin. For Li-ion battery, crucial components are anode and cathode. Many of the recent attempts are focusing on formulating the electrodes with the elevated specific capability and cy.
