

Charging station solar energy supplier

Overview

Electric vehicles are powered by a series of batteries which sit beneath the floor of the car. A control unit manages how much energy is required (thousands of times per second), and an interactive touchscreen on the side of the car. Many EV drivers are choosing to install their own home charging point, so they do not need to worry about locating a station while they are out (with the exception of long journeys), or the speed at which an EV will charge depends on the make and model of the car, but it is measured in kilowatts (kW). An EV home charging point will charge an EV at 3.7 kW or 7 kW. The average price of electricity in the UK is 14p per kWh or 8p on Economy 7 (overnight). An electric car will cover around 3.5 miles per kWh (on average), which works out to be around 100 miles per kWh. Solar panels are the perfect partner for an EV home charging station, as buying solar panels is like bulk-buying fuel for your EV. If you are planning on installing an EV home charging station.
