

How many volts of battery are suitable for outdoor power supply

Overview

Remember that camping on site using a 230V electricity supply within caravans, motorhomes and tents requires even more care than in the home. Because your unit is mobile there is a greater likelihood of things going wrong. The Club recommends you bring a 25m cable with you. A pitch with electrical hook-up will have an electrical supply bollard within about 20 metres. Each Club hook-up bollard is individual. The socket outlet of the Club's site hook-up points complies with the British Standard BS EN 60309-2. Your connecting lead will need a plug to match this socket outlet and a connector to match the battery box. The ends of the cable take the most abuse especially the end on the type that passes into the battery box and where the door shuts onto it. During tests with an infrared camera it is noticeable. When you are ready to connect to your hook-up, make sure the RCD is in the off position and then connect your hook-up to your unit. Only then should you connect to the campsite hook-up.
