

Reason for air intake into generator air cooler room

Overview

It removes heat, pulls in fresh air, and reduces the temperature of the room to a degree where the equipment can operate correctly; hence breakdowns are minimized and safety increased. The general idea is the same for every ventilation design sheet. Engine room ventilation air (cooling air) has two basic purposes: To provide an environment that permits the machinery and equipment to function properly with dependable service life. Check with the generator's manufacturer to determine the optimal cooling method for the system. Factors such as climate and direction of prevailing winds must be. When diesel generator room adopts clean ventilation, Please calculate the intake air volume and the exhaust air volume as follows: When the diesel generator room is water cooled, It is calculated according to the ventilation required that eliminate harmful gases in the diesel generator room. Normally. Here we have 2 objectives first to calculate the ventilation air quantity and 2nd to calculate the intake air louver area $Dt = (T2-T1) \text{ Temp.}$
