

The latest lithium-sulfur battery technology in Central Africa

Overview

Technology and its advancement has led to an increase in demand for electrical energy storage devices (ESDs) that find wide range of applications, from powering small electronic gadgets such as smartphone. ••Lithium sulfur batteries (LiSB) are considered an emerging technology for s. Throughout the past decade, there has been a significant increase in the need for energy on a global scale. This is as a result of the increased economic and social progress seen du. LiSBs are constituted of a sulfur cathode, making them a potential contender considering cost and energy density, with LiBs. In general, LiSBs are constructed in the same way a. As discussed in Section 2, LiSB contains a lithium-based anode, a sulfur-based cathode, an electrolyte, and a separator as shown in Fig. 5. The LiSB redox process covers the entire. In theory, LiSB has a specific energy density three to five times higher than LiB. This means that they have the potential to be a better option for large scale operations.
